A Database as Fast and Fluid as Your Development?
With Database Builder, It's Possible.

You have a great idea for a new product application. Your software developers are eager to get started and clients have already expressed interest. But the DB team isn't too thrilled with the idea of a database refactor and you're backlogged before you even get started.

Sound familiar?

It's a common problem and, until now, there just hasn't been an easy solution. Traditional database structures are, by nature, rigid and temperamental. Nobody wants to mess with them and even the slightest change can require weeks — or, let's be honest, months — of slow, tedious work for the QA engineers.

But why should your database be the deciding factor in your company growth? What if you could reverse the status quo and make your database work for you?

Rethinking Databases

Although absolutely necessary for the integration of intuitive product applications, you probably view your database more as an operational concern than as a simple product component. And why not? One little cough and the whole system has the flu.

But with Database Builder, you gain a whole new perspective on database development and deployment. Instead of an outside dependency, your database becomes a living, malleable part of your product, ready to respond to the fast-paced demands of your overall technological growth.

A Change Even Your QA Team Will Appreciate

There's nothing more important that quality data, which is something any QA team that's spent untold hours writing step-by-step test scripts will tell you. But there's also nothing more unwelcome than a database refactor, which, all too often, takes forever and wastes valuable resources that could be spent developing new features and applications.

Database Builder changes all of that. With the power to version control, test-drive and collaborate on a database just like you would with code, Database Builder makes your database development as intuitive as the applications it supports. Plus, you get the freedom to administer changes without the risk of compromising valuable data already in production.

Try Database Builder Today

Click here to download a free 30-day Database Builder trial today. Or, if you're ready to find out what having a database as fast and fluid as your development can mean for your company, click here to order Database Builder now.

With free email and maintenance support and unlimited maintenance updates, your licensed copy of Database Builder is the tool your development team needs to put your database to work for you.

Don't let a database refactor stand between you and your next idea for a great new application — buy your copy of Database Builder today.

One development team is defined as a single group consisting of up to nine people and capable of producing a whole software product unaided. An example of a software development team is a Scrum team.

Hexagon Software: Responsive Solutions for Evolutionary Innovation

You run a fast-paced business with an emphasis on honest communication, elegant software design and an embracing attitude toward change.

Shouldn't your development tools do the same?

At Hexagon software, we believe they should — that's why we've built and developed a host of lean, agile software solutions that work in tune with your development objectives. We understand the importance of efficiency and fast deliverables and we know that a software package is only as good as its output.

You depend on strong applications to power your most important products and you need tools that complement your design. You can depend on Hexagon Software because our products work seamlessly within your development cycle for one simple reason: we've designed them that way.

Explore what Hexagon Software has to offer — and see what honest communication, elegant software design and an embracing attitude toward change can mean for you.

Introducing Database Builder

A revolutionary new tool created to overcome the frustration of traditional database development and deployment, Database Builder is the first database system to integrate your database as a malleable, living part of your product suite. Click here to learn more about Database Builder and download your free 30-day trial now.
