

Growing Food
on a **Warming Planet**

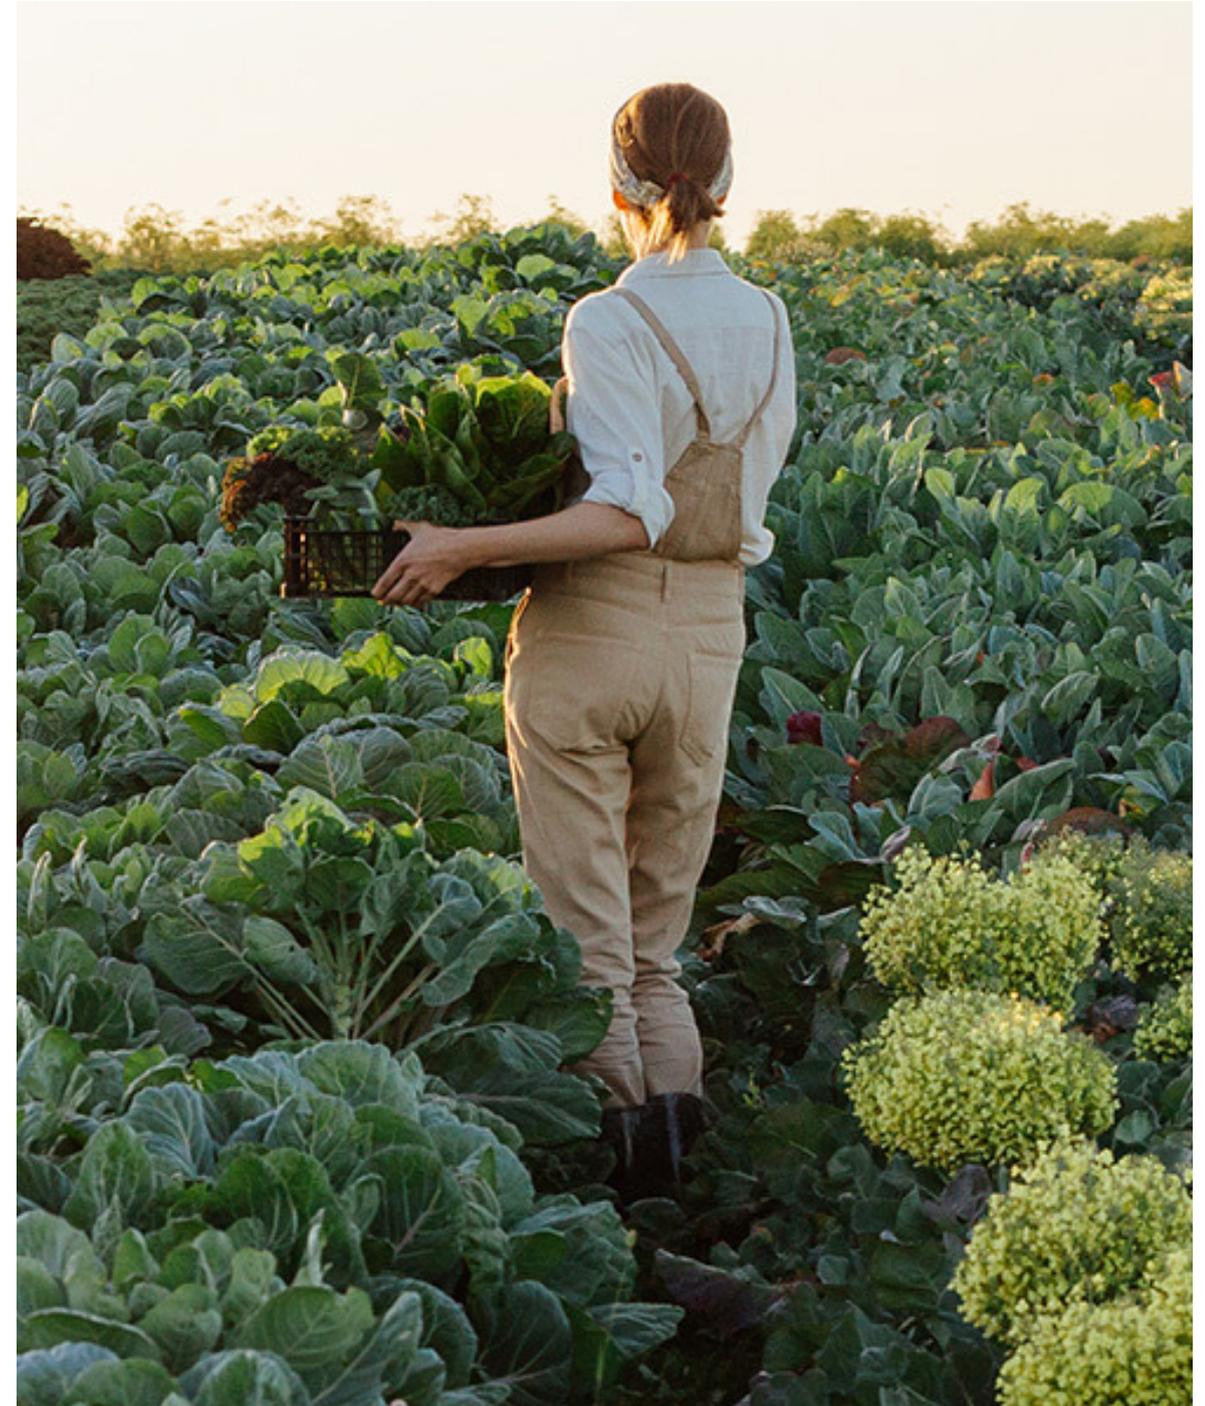

Exploring Climate Change and Sustainable Food Systems

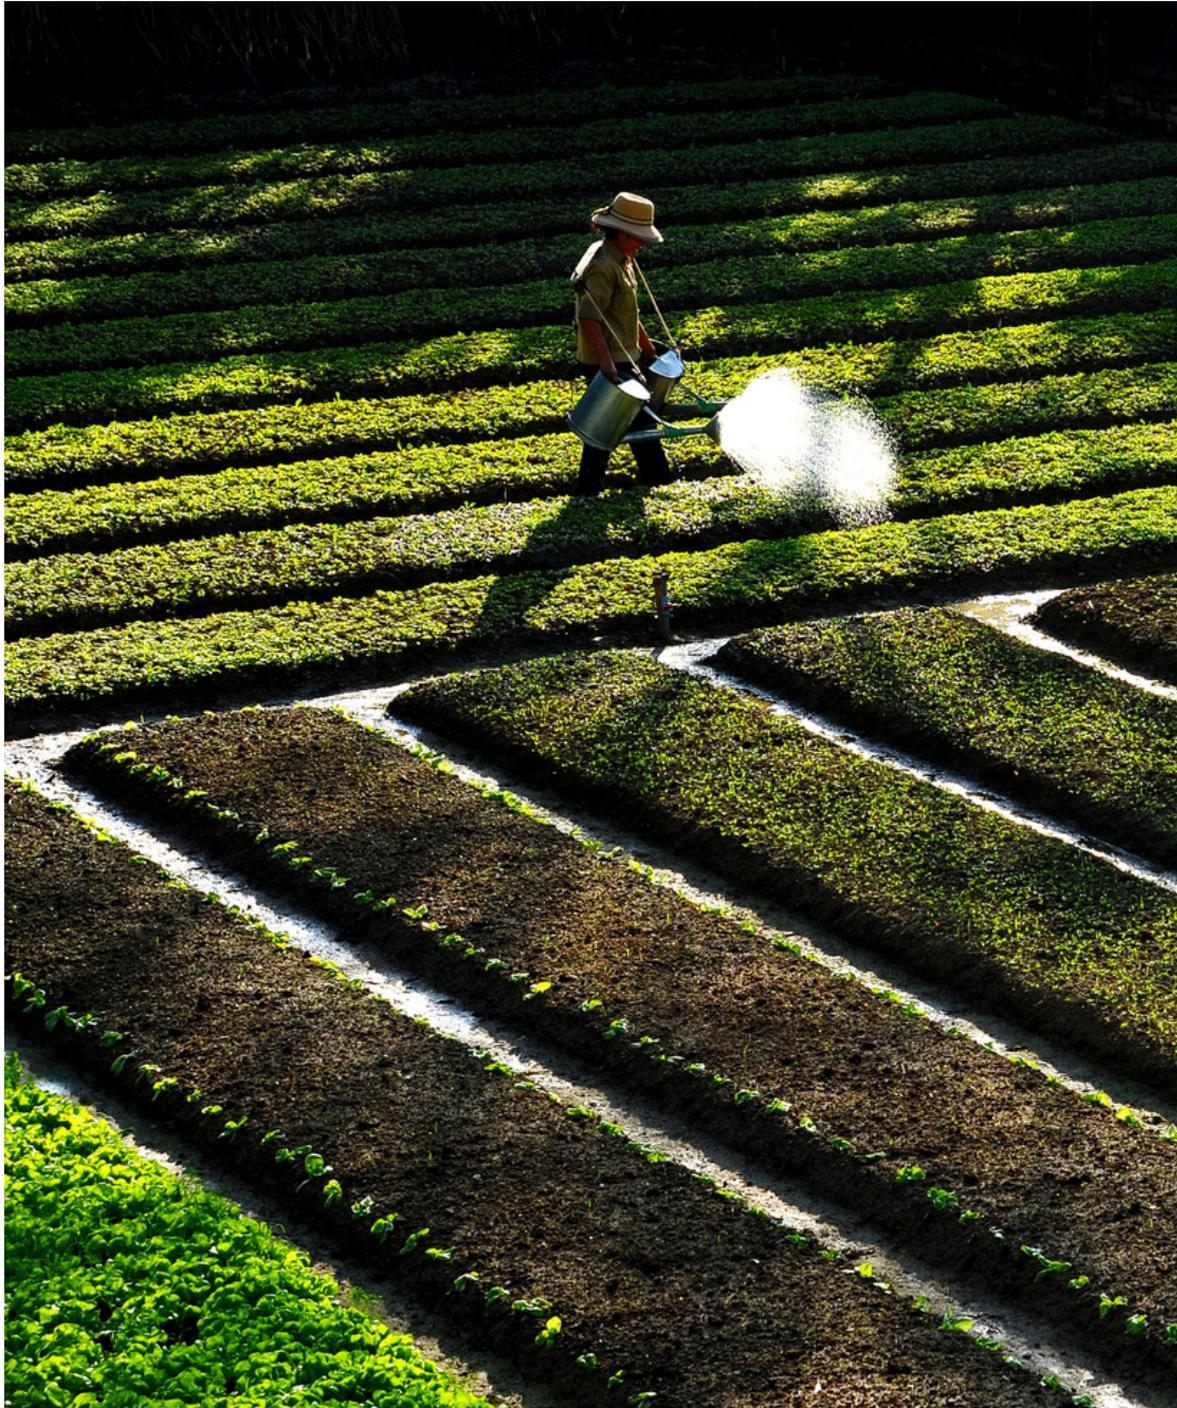

An exhibit that *inspires*

Climate change and agriculture are interconnected processes that transpire globally. Climate change is putting global food production at risk, and conversely, modern agricultural practices are placing immense pressure on resources and the environment. To overcome this challenge, we need to adopt a sustainable approach to food production.

Through captivating imagery, storytelling, and interactive experiences, guests will learn about the impacts of climate change on food production, while also understanding the meaningful climate mitigation opportunities that sustainable practices offer.

A closer look

Our health and the health of our planet are directly connected. Sustainable agricultural practices ensure global food security, promote equity, and protect the ecosystems on which agriculture depends.

Adopting a **sustainable approach** to food production is crucial to preserving and revitalizing our environment, ensuring economic and social stability, and feeding a growing global population.

How does our *diet* affect the environment?

What we eat matters. The food choices and consumption habits we make every day have a big effect on the environment and climate change. The good news is that even small changes in what we buy and eat can add up to real environmental benefits!

With special help from our local partner, Foodwise, this exhibition will educate guests on the effects of an unsustainable diet and offer simple, attainable solutions they can implement at home.

We have a choice about what we eat. Let's be mindful of the impact our food choices have on the environment.
